Overall Conclusions

By using several software, we were able to implement the concept of paperless office to some extent. Of course, any software needs a lot of time to fix possible bugs and errors, and since none of the human-made products are free from errors and bugs, then our software is also not free from bugs and errors.

This project has been designed and programmed in order to optimize the methods of using time, human and financial resources and to mechanize the bookkeeping and accounting affairs of contracting companies. By using this software, you will save your time and money and increase the efficiency and accuracy of your work. This software, which is applicable under all versions of Windows, is produced by Visual C#.net Enterprise Edition 2008 software and SQLServer2005 and Crystal Reports and graphic software such as Photoshop, etc. have been used.

We were able to check all the features of this software. In addition, we were able to have a simple and general view of the software and the important entities inside it. By using ER, DFD and UML diagrams, you can determine the flow of data entry and exit and have a better view of them. To be able to design a software that is immune from any memory loss and redundancy in the database. It is hoped that these documents will be used by loved ones.
